

THE WEEK AHEAD, 7 NOVEMBER 2025

The “Age of Intelligence”

Sam Altman, co-founder of OpenAI and a key driving force behind ChatGPT, envisions humanity entering a new “age of intelligence” following the agricultural and industrial eras. As ever, technological progress is propelling this paradigm shift—this time with **machine learning** taking it to an entirely new level.

On capital markets, too, assets within the **artificial intelligence (AI)** universe have quite literally been catapulted into their own orbit and meanwhile determine the pace of equity markets, particularly in the United States and China. From an economic perspective, too, technology has become a defining growth driver. A closer inspection reveals that a substantial share of the increase in US gross domestic product (GDP) during the first half of 2025 stemmed from technology and software-related investment—around 1.3 percentage points of the total 1.6% expansion. In other words, the sector accounted for just over 80% of overall growth.

Economics & Strategy

Against this backdrop, it is worth taking a more in-depth look at the prospects for technology and artificial intelligence. Several factors indicate that the **current boom is likely to continue**:

- Still plenty of AI “success stories”: The number of users is growing, more and more companies are deploying AI and machines are increasingly performing human tasks just as well or even more effectively than people.
- No signs of overcapacity: Despite exponential growth, computing capacity in data centres remains constrained. Customers face waiting times and processing power is effectively being rationed.
- Stable funding base: The bulk of capital financing the rapid expansion of data centres and supporting energy infrastructure comes from the cash reserves of a few major technology firms, many of which operate in oligopolistic or near-monopolistic market structures. Consequently, the financing of AI growth is now less reliant on speculative risk-taking or venture capital than in previous cycles. Nonetheless, capital is not limitless, and shareholders of large tech companies continue to demand robust returns.
- Valuations elevated but not excessive: While company

→ Behavioural Finance: Outsmart yourself!

Rising gold and oil prices, fears of inflation and recession – geopolitics are at the top of the agenda. Particularly in times of heightened uncertainty, there is an increased risk that our actions will be determined by behavioural patterns that are anything but rational. This is why the findings of behavioural finance are more important than ever. But even more important than self-knowledge is the ability to outsmart oneself.

→ COP 30 preview: back to reality?

The host city of this year’s COP is known as the gateway to the Amazon, but after the disappointments of recent conferences, can the event still be a gateway to progress on climate commitments?

valuations within the AI sector are high, they have not yet reached the extreme levels seen in past market peaks.

The following aspects point to **initial signs of overheating**:

- Historically, sectors at the forefront of technological change have often succumbed to phases of overinvestment. Periods of surging capital expenditure and rapid capacity expansion are typically followed by temporary phases of disillusionment, during which revenues fall short of covering investment costs. At such times, decisions are driven less by sound economic rationale and more by fear of missing out and pressure to align with prevailing trends. A similar dynamic may well emerge during the current cycle of innovation. In the longer term, however, the substantial technological advances achieved are likely to translate into significant gains in prosperity.
- The AI ecosystem is increasingly characterised by an obscure network of overlapping equity interests, as well as intertwined customer and supplier relationships. This growing interconnectedness raises concerns about insufficient transparency and potential conflicts of interest.

Ultimately, there is no way of knowing when, or whether, periods of euphoria and optimism about the dawn of a new “age of intelligence” will give way to temporary disenchantment. Having specific insight into areas where capacity constraints persist and signs of saturation are emerging is likely to prove critical. In the past, investment booms have faded when capital returns have declined and investors have been hesitant to provide additional funds (i.e., when the cost of capital has risen). At present, however, there are few indications of such a turning point and participation in the emerging “age of intelligence” therefore continues to appear attractive.

Needless to say, there are many compelling trends and opportunities beyond technology and AI. Below are some thoughts on the global **tactical allocation for equities and bonds**:

- Opportunities are by no means confined to the US equity market: The MSCI **Emerging Markets** index has also begun to attract renewed inflows. These inflows, combined with the fact that emerging markets remain largely underweighted in global portfolios, provide favourable conditions for a recovery already well underway in countries such as South Korea and Taiwan. In **Asia**, **Japan** has likewise benefited from a recent policy shift towards reduced fiscal consolidation and a more cautious or delayed approach to normalising what remains a highly accommodative monetary policy stance.
- In **Europe**, **Germany** is approaching the actual disbursement of its fiscal stimulus package next year. Equity markets in southern Europe, particularly Spain and Italy, are benefitting from their strong exposure to

the banking sector—a segment characterised by consistently solid earnings, sound credit quality, attractive shareholder returns in the form of dividends and share buybacks and still-reasonable valuations. In contrast, the **French equity market** may face additional headwinds over the medium term due to ongoing political uncertainty.

- This is also true for **French government bonds**, with the future of fiscal policy there still unclear. Fiscal policy in the UK also remains source of unpredictability, a factor that is likely to ensure ongoing volatility in both countries' government bond markets.
- Investors also face challenges in navigating the **US Treasury market**. Following the turbulence triggered by President Trump's "Liberation Day" tariff announcement on 2 April, the market subsequently steadied, with the 10-year Treasury yield retreating from levels above 4%. More recently, however, yields have edged slightly higher after several US central bank officials tempered expectations of further rapid interest rate cuts. Against this backdrop, a neutral allocation to US Treasuries appears appropriate at present.
- The **US dollar's** status as a "safe haven" currency remains under pressure. While a tactical countertrend may emerge, structural factors (monetary and trade policy, US debt) are likely to weigh on the greenback in the longer term.

Despite the disruptions shaping our world, the emerging "age of intelligence" warrants a measured degree of optimism.

Yours,
Stefan Rondorf

Investment theme: → Investment income for the "age of intelligence".

- → **Demographics**: The world's population is growing but at an increasingly slower rate, while life expectancy is steadily rising. The overall global population is aging, and the potential working-age population is shrinking – most dramatically in industrialised economies.
- → **Digitalisation**: "Smart machines" are leading to radical changes in employment structures.
- The question as to what kinds of tasks will remain available for humans to perform and how many jobs will be available inevitably leads to the issue of their remuneration. In this respect, the labour economist Richard Freeman envisages a paradigm shift in the relationship between human and mechanised labour. With a hint of irony, he gets to the heart of the matter when he asks, "Are you going to work for the robot or is the robot going to work for you?"¹
- Consequently, factors such as robots and demographics suggest that the time has come for a conversation on investment income to supplement income from work.
- We need more investment income, especially in an age of smart machines and a state pension scheme creaking under the pressure of demographic change. However, it does not end there. Indeed, investment income can be put to a great many more welcome uses: more money for a holiday, for everyday purchases or as a "grandparents' grant" to support grandchildren during their apprenticeships and university studies, ...
- Investment income can originate from two sources: interest from bank deposits, coupons paid on bonds or dividends paid on equities.
- In conclusion, the time has come not just to focus on the total return of an investment but also on its expected future cash flows. Why should our money (or the "robots") not work for us?

Investment involves risks, in particular, risks associated with investment in emerging and less developed markets. Any past performance, prediction, projection or forecast is not indicative of future performance. Investors should not make any assumptions on the future on the basis of performance information in this document. The value of an investment and the income from it can fall as well as rise as a result of market and currency fluctuations and you may not get back the amount originally invested.

Investing in fixed income instruments (if applicable) may expose investors to various risks, including but not limited to creditworthiness, interest rate, liquidity and restricted flexibility risks. Changes to the economic environment and market conditions may affect these risks, resulting in an adverse effect to the value of the investment. During periods of rising nominal interest rates, the values of fixed income instruments (including short positions with respect to fixed income instruments) are generally expected to decline. Conversely, during periods of declining interest rates, the values are generally expected to rise. Liquidity risk may possibly delay or prevent account withdrawals or redemptions.
